RamSaver is a program that I created for a friend that runs into issues with his RAM. This is what I want to share with you guys. Note that the data is provided directly from his computer so you don't have to worry about all the numbers being off because of something specific I have done (I haven't had a chance to test and see what happens when you run it, but I'll tell you what I can). If you look at the top chart, you can see what we call the amount of "Freed RAM" and "Used RAM". What this means is that the amount of free memory is very little compared to the amount of used memory. Essentially, "Free Memory" means the amount of RAM that is left at the moment and "Used Memory" means the amount of RAM that has been used by the currently running program (or programs). Now on to the bottom chart. The bottom chart is for the amount of allocated RAM. You can see that the programs only see 4096 bytes of RAM that is allocated. Basically, if your RAM is 67% allocated, that means that the current program is taking up 67% of the RAM (and all the other programs can't see it). Another good thing to know is what the amount of "Resident Set Size". Essentially, you have "Resident set size" on your PC if it exceeds 4.9GB or if all the RAM is taking up by all programs. Finally, if you run the program over a period of time you
